Background

The Co-occurrence of partner and child maltreatment
- Researchers have highlighted co-occurrence rates of 30-60% (Edleson, 1999; Browne & Hamilton, 1999; Appel and Holden, 1998).
- The majority of studies examine the aetiology, maintenance and intervention of partner and child maltreatment separately, treating them as discrete entities.

Patterns of family violence
- Typologies of men who abuse their female partner (Holtzworth-Munroe & Stuart, 1994).
- Adopting an interactionalist approach to family violence, researchers have suggested that aggression is a product of the person-environment interaction (Trude, 1991).

Reciprocal Family Violence
- F to C to M to F

Hierarchical Family Violence
- F to M to C to F

Paternal Family Violence
- F to C to M to F

Research Questions
1. Examine the prevalence of patterns of family violence in the present sample.
2. Examine the type of child maltreatment perpetrated by mothers and fathers in each pattern.
3. Examine the extent to which parenting couples (dyads) who both maltreat their child use the same form of child maltreatment.

Aim
- To examine the feasibility and prevalence of the Paternal, Reciprocal and Hierarchical patterns of family violence proposed by Dixon & Browne (2003) within a sample of maltreating families.
Method

Sample
- Examined psychological reports of 162 parents who had been assessed by a Forensic Psychology consulting service for their suitability to parent their child/ren, following allegations of child maltreatment
- Parents from the English Midlands and South Wales
- Parents assessed by the practice between June 1996 and June 2003 were investigated
- Parent ages ranged from 17 – 56 years (mean age 30; SD = 8.14)
- The age of the index child ranged from 1 month to 15 years (mean age = 4.6, SD = 4.26)
- 91.4% parents were classified as white UK

Results
- Of the total sample of 162 parents:
  - 104 (64.2%) resided in a family in which physical partner abuse and child maltreatment co-occurred
  - 68 (42.7%) perpetrated both partner and child abuse (43 (65%) fathers and 23 (35%) mothers)
  - Fifty-eight (35.8%) parents resided in a family where only child maltreatment occurred
- Examine the prevalence of patterns of family violence in the present sample (n=104)
  - Paternal (n = 14; 13.5%)
  - Reciprocal (n = 43; 41.3%)
  - Hierarchical (n = 47; 45.2%)

Cont’d

1. Examine the prevalence of patterns of family violence in the present sample

HIERARCHICAL

</table>

Summary & Conclusions

- The 3 hypothesised patterns of family violence, proposed by Dixon and Browne (2003), exist in this sample.
- It is important for professionals to consider how each person in the family is influenced and affected by every other member in that unit, rather than examining only the adult male aggressor within the family.
- Verifies the need for service provision and professionals to recognise the coexistence of different forms of violence within the family unit.
